PORTFOLIO / DOCUMENTATION SYSTEMS

# Governance people can find, follow, and maintain.

Selected work in information architecture, controlled documentation, workflow design, and cross-functional validation. These case studies show how complex systems become understandable and maintainable.

**60+ pages**
Governance operating guide

**3 environments**
Repository structures aligned

**End-user tested**
Navigation reviewed with stakeholders

## 01 INFORMATION ARCHITECTURE & GOVERNANCE

**Challenge.** Information was scattered across SharePoint, Teams, and OneDrive, with inconsistent naming, navigation, ownership, and storage practices. **My contribution.** Designed taxonomy, repository architecture, metadata and naming guidance; authored a 60+ page operating guide with process graphics and quick references.

### ILLUSTRATIVE CONTENT CONTROL MODEL

| Content type | Where it belongs | Key metadata | Review trigger |
|---|---|---|---|
| **Procedure / SOP** | Canonical procedure library | Owner, status, review date | Process or policy change |
| **Quick reference** | Job-aid collection, linked to SOP | Audience, linked SOP | Source procedure revised |
| **Training guide** | Enablement materials | Platform, audience, revision | Tool or workflow updated |

Representative, sanitized structure; not a production schema or system screenshot.

### DESIGN LOGIC

Organize by the work a person needs to complete, then establish predictable labels, ownership, review cues, and maintenance rules. Keep the guide usable by the next person who inherits it.

### VALIDATION

Branch representatives navigated proposed structures using real work material, challenged labels and pathways, and revealed gaps. Feedback informed revisions and visual quick-reference guidance.

CASE STUDY / PROCEDURAL STANDARDIZATION

# Clear steps. Verifiable handoffs.

A role-based SOP suite converted a complicated onboarding and offboarding process into repeatable instructions across personnel categories and participating teams.

**6 guides**
Coordinated procedure suite

**230+ actions**
Dependencies and branches mapped

**Division-wide**
Selected as common guidance

## 02 ROLE-BASED ONBOARDING & OFFBOARDING SOPS

**Challenge.** Different personnel pathways and dependent tasks created ambiguous handoffs. **My contribution.** Wrote six coordinated guides covering role-specific actions, prerequisites, branching conditions, concurrent work, accountable owners, and completion evidence. The suite was selected for division-wide use.

### REPRESENTATIVE SOP EXCERPT / RECONSTRUCTED

| Step / trigger | Instruction | Responsible | Evidence |
|---|---|---|---|
| **01 Check intake** | Confirm that request type and required fields are present. | Intake owner | Validated request record |
| **02 Select route** | Use the correct role-based pathway; record the selected branch. | Coordinator | Path documented |
| **03 Track dependencies** | Identify prerequisite reviews and parallel work before advancing. | Assigned step owner | Open items and owners visible |
| **04 Confirm closure** | Verify the required evidence before marking the request complete. | Process owner | Completion evidence retained |

This excerpt demonstrates documentation structure; no internal instructions or access details reproduced.

### THE WRITING RULE

Every operational step should answer: **When do I do this? What exactly do I do? Who owns it? What proves it is finished?** If there is an exception, the reader also needs the next action and escalation owner.

CASE STUDY / LIFECYCLE & WORKFLOW AUTOMATION

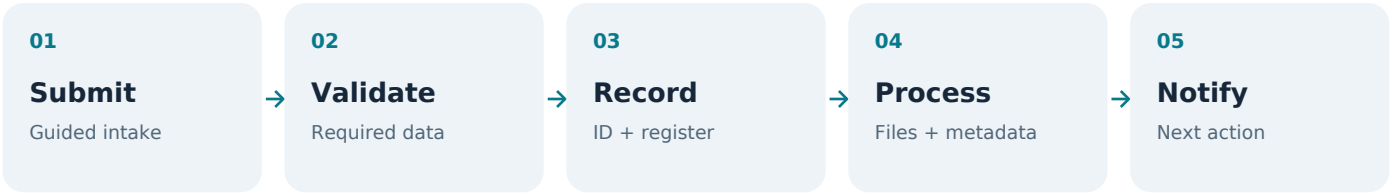

# One submission. A traceable lifecycle.

The CDRL workflow illustrates how documentation controls become easier to follow when they are built into the act of submitting and tracking the deliverable.

## 03 SUBMISSION & TRACKING WORKFLOW

**Challenge.** Manual intake made report identifiers, metadata completeness, attachments, status visibility, and recovery inconsistent. **My contribution.** Mapped the lifecycle, built a guided intake and tracking pipeline, tested key paths, and documented contributor and administrator actions.

### SANITIZED LIFECYCLE VIEW

**EXCEPTION PATH**

Missing data → correction request. Processing failure → actionable administrator alert, targeted recovery, and confirmation that the record is consistent.

### REPRESENTATIVE STATUS COMMUNICATION / RECONSTRUCTED

| Workflow state | Example message content | Why it matters |
|---|---|---|
| **Accepted** | The submission was recorded as **[Report ID]**. Retain this identifier for follow-up. | Submitter knows the record exists. |
| **Correction** | Required information is missing. Update the indicated field(s) and resubmit the record. | Submitter knows what to change. |
| **Processing error** | **[Report ID]** did not complete **[Step]**. Review the failed operation and confirm file linkage. | Administrator can investigate. |

Illustrative communication structure; message text and identifiers are reconstructed.

**RECOVERY CONTROL**

Identify the failed step → inspect record, assigned ID, and file association → correct and retry the affected step → verify the final state before closeout.

PRACTICE / TESTING, ADOPTION & SUSTAINMENT

# Documentation is a system.

Not a handoff file. My work connects clear writing with practical controls: stakeholder review, user validation, exception handling, consistent ownership, and usable maintenance guidance.

## 04 QUALITY & OPERATIONAL IMPROVEMENT

### REVIEW LENS FOR CONTROLLED CONTENT

| Control | Question | Verification method |
|---|---|---|
| **Accuracy** | Is the owner, prerequisite, and required action correct? | Review with process owner |
| **Findability** | Can personnel locate the right guidance by task and role? | Navigation / user walk-through |
| **Lifecycle** | Are state, revision, and review triggers understandable? | Status / metadata inspection |
| **Exceptions** | If a step fails, does the instruction say what happens next? | Failure-path test |
| **Maintainability** | Can another administrator trace, update, and verify the process? | Handoff / recovery check |

### ADDITIONAL EVIDENCE

**10 workshops**

Facilitated structured discovery with 250+ participants.

**50+ proposals**

Assessed fit, implementation risk, and usability for leadership.

**15+ videos**

Taught Agile / Jira practice and user-centered design methods.

### WHAT CONNECTS THESE PROJECTS

The common thread is practical document control: translating end-user needs into clear guidance, coordinating reviews across functions, making ownership, status, and exceptions visible, and enabling long-term maintenance. The examples show **transferable methods**; diagrams are sanitized reconstructions.
